1. INTRODUCTION

The perceived level of productivity and customer service provided by the insurance industry in Malaysia has deteriorated due to lack of skilled and competent workforce. Organization today, specifically insurance industry is aware of the importance of human resource management (HRM) as the leading indicator in achieving improved sales growth and the creation of innovative insurance products. Therefore, local insurance firms have to be more efficient, productive and innovative on its HRM practices implementation that is closely aligned to the firm’s objective, business needs as well as the culture to sustain competitive advantage in the market. The contribution of this paper...
to the literature is twofold. First, the conceptual model of the study tested the relationship between HRM best practices and firm performance at the organizational level. The second contribution is to demonstrate the impact of the strength of the HRM best practices on firm performance.

2. BACKGROUND OF THE STUDY

The impact of globalisation, market force and highly competitive markets has forced the insurance industry to be competitive (Kundu & Malhan, 2009) in order to sustain in the market, locally and internationally. A high level of skilled and competent workforce can contribute to the firm’s success by developing a comprehensive and internally cohesive human resource management (HRM) system that is embedded in the organization’s structure and culture (Liu et al., 2007). A synergistic HRM system is a pathway through which the firm’s human capital has the potential to become an important source of competitive advantage and to enhance firm performance (Boxall & Purcell, 2003) by shifting their focus to making service quality, productivity, product innovation and sales growth a priority in gaining competitive advantage.

Strategic HRM practices generally focus on human resource strategy, integration and add to the key notions of strategies (Armstrong, 2007). Literature review shows that organizations engaging or adopting HRM best practices will outperform organizations that do not. Given the rapid growth and development in the insurance industry, human resources are considered a firm’s key internal resource and are increasingly deployed as the source of competitiveness in an organization. A great number of empirical studies show that the best practices of HRM has positive relationship on firm performance and also can be the source of sustainable competitive advantage to the organization (Schuler & MacMillan, 1984; Ulrich, 1991, Wright & McMahan, 1992; Huselid, 1995; Jackson & Schuler, 1995; Bjorkman & Fan, 2002; Collins & Clark, 2003; Guest et al., 2003; Panayotopoulou et al., 2003; Wright et al., 2005; Hiltrop, 2005; Gooderham et al., 2006; Othman, 2009).

3. LITERATURE REVIEW

There is little agreement as to which HRM best practices can be considered as strategic in an organization (Paauwe, 2004; Marchington & Grugulis, 2000). However, there is a broad consensus that there is a positive link between HRM practices and firm performance (Wattanasupachoke, 2009; Tessema & Soeters, 2006; Wright et al., 2005; Bjorkman & Fan, 2002; Singh, 2003a; Bae & Lawler, 2000; Huselid et al., 1997; Harel & Tzafrir, 1999; Huselid & Becker, 1996; Huselid, 1995; Arthur, 1992). Huselid’s (1995) groundbreaking study established that a set of human resource practices, also known as high performance work systems (HPWS) were strongly related to turnover, accounting profits and firm market value. Since then, many studies have shown similar positive relationship between HRM practices and various measures of firm performance such as productivity and quality in the auto assembly plants (MacDuffie, 1995), accounting profits in the bank sector (Delery & Doty, 1996), employee productivity, machine efficiency, and customer alignment and its link with quality manufacturing strategy (Youndt et al., 1996),
and profitability (Guthrie, 2001). The literature review in this study includes only those studies covering multiple HRM practices, because the focus is on the HRM system as a whole that promotes overall firm performance. The review on measurement of organizational outcomes (productivity, quality, and service) and capital market outcome (sales growth) is based on Dyer & Reeves’s (1995) and Delaney & Huselid’s (1996) studies.

Review of literatures indicate that essential HRM practices such as workforce planning (Mathis & Jackson, 2004; Chang & Chen, 2002), training and development (Khan, 2010; Katuo & Budhwar, 2006; Ahmad & Schroeder, 2003; Kundu, 2003; Chang & Chen, 2002; Lam & White, 1998; Ngo et al., 1998), recruitment and selection (Khan, 2010; Katuo & Budhwar, 2006; Kulik, 2004; Ahmad & Schroeder, 2003; Chiu et al., 2002; Lam & White, 1998), performance appraisal (Khan, 2010; Chang & Chen, 2002; Bernardin & Russel, 1993), career planning management (Schein, 1996), compensation (Ahmad & Schroeder, 2003; Chiu et al., 2002; Lam & White, 1998; Ngo et al., 1998), internal communication (Ulrich, 1997; Richard & Johnson, 2001; Geringer et al., 2002; Oladipo & Abdulkadir, 2011; Osman et al., 2011), and job design (Champion, 1988; Morgeson & Humphrey, 2006) have positive association with firm performance. These practices capitalise on the strength of the human capital for sustained competitive advantage (Jackson & Schuler, 2000). Furthermore, these studies also provide an insight to the management and human resource practitioner to exercise these practices as strategic tool for superior performance (Khan, 2010).

Akhtar et al. (2008) adopted Delery & Doty’s (1996) seven best practices (i.e. training, participation, employment security, job description, result-oriented appraisal, internal career opportunities, and stocks/profit sharing) approach to examine the validity of HRM practices and their effects on company performance among the 465 Chinese enterprises. The findings showed that training, participation, result-oriented appraisal, and internal career opportunities were identified as the “core” of HRM practices that positively affect both product/service performance and financial performance. Akhtar et al.’s (2008) findings are consistent with the results study done by Shipton et al., (2005). On the other hand, Gooderham et al. (2006) conducted a similar study using a factor analysis of 80 different HRM practices on its relationship with organizational performance among the European firms. The study shows that training monitoring, share-options, evaluation of Human Resource Department, profit-sharing, group-bonus, and performance related pay have a statistically significant impact on performance. Furthermore, Ngo et al.’s (1998) findings indicate that firms that provide more structural training and development create more new products, have more satisfied employees and higher sales. Fey et al. (2000) also finds that non-technical training, high salaries and promotions based on merit will have a direct positive impact on firm performance among the managers while job security among the non-managerial employees.

Universalistic perspective focuses on the ‘best practices’, which implies that firms will be better off if they identify and adopt ‘best practice’ in the way they manage people (Boxall & Purcell, 2000). In other words, some human resource practices are always better than others (Rose & Kumar, 2006).
regardless of the firm, its strategy or its environment (Delery & Doty, 1996) and all organisations should adopt them (Miles & Snow, 1984). From this perspective, for a firm to have effective human resource practices, it needs to copy and implement these universal best practices. There are many empirical evidences suggesting that human capital is the pre-eminent organisational resource and the main key to achieving superior performance. Therefore, human capital provides organisation with an important source of sustainable competitive advantage (Huselid, 1995).

The universalistic academicians consider strategic HRM practices to positively influence firm performance and help firms improve their human resource cost benefits, improve operating efficiency, increase innovation, and increase overall organisational performance benefits (Dyer & Reeves, 1995). According to Osterman (1987) and Sonnenfeld & Peiperl (1988), the most influential best practices set consist of seven practices namely internal career opportunities, training systems, appraisals, profit-sharing plans, employment security, voice mechanisms (grievance systems and participation in decision making) and degree to which jobs are narrowly designed. Many scholars have supported this universalistic prediction (Terpstra & Rozell, 1993; Delery & Doty, 1996) and firms desire to succeed in today’s global environment and competition must make appropriate human resource investment to acquire and develop human capital who acquire better skills, capabilities, and knowledge than their competitors.

In summary, the above reviews have unified a list of HRM practices needed for HRM best practices research and argued that it is the synergistic effect of multiple HRM practices that contributes to firm’s performance. Organization needs to develop a human resource system that achieves both horizontal and vertical integration in achieving competitive advantage. However, there is no consensus or consistency evidence illustrating what constitutes these HRM best practices that associate with high firm performance. While a substantial body of literature has been developed linking HRM best practices to firm performance, this research study applies the universalistic perspective of human resource practices to:

1) Investigate the individual HRM best practices on firm performance in the Malaysian insurance industry.
2) Assess the relationship between HRM best practices and firm performance in the Malaysian insurance industry.

Identifying the important components of HRM best practices for firm performance will help us better theorize the nature and impact of HRM-performance relationship. Therefore, from the literature review, the conceptual model of this study is presented in Figure 1.

4. RESEARCH METHODOLOGY

The descriptive research method is used to facilitate the description of the SHRM and firm performance of seven major insurance firms operating in Klang Valley. The descriptive method provides logical approach because the data consisted of the perceptions of respondents, which were gathered through the administered survey questionnaire. This method of data collection was chosen for this study as it provides greatest anonymity and lowest chance of biasness. The sample was composed of the non-executive, executive and managerial/top management employees of seven major
insurance firms available in Klang Valley. Permission was granted from the Life Insurance Association of Malaysia and General Insurance Association of Malaysia to conduct this survey among its members. A total of 350 questionnaires were distributed to seven different major insurance firms using the method of stratified sampling. The response rate is 89%. For the purpose of this study, the survey questionnaire constitutes three parts. The first part comprises demographic characteristics of the respondents such as gender, name of organization, age, education, year of service, designation and total employees. The second part of the questionnaire consists of 64 items which represent eight HRM best practices and rated anonymously by the respondents on a 5-point Likert scale of 1 = “strongly disagree” to 5 = “strongly agree”. The third part of the questionnaire measures the firm performance by the following variables namely: 1) rate of productivity of your company, 2) customer service, 3) quality of products, and 4) sales growth developed by Dyer & Reeves (1995) and Delaney & Huselid (1996). Respondents were to rate on a 5-point Likert scale of 1 = “very poor” to 5 = “very good”. The overall Cronbach’s Alpha score is 0.87. The collected data were analyzed using the Statistical Package for Social Science (SPSS) Version 19. The analysis of data began with the reliability test for the scales using Cronbach’s Alpha. This is followed by the examination and presentation of demographic profile of respondents using descriptive statistics. Pearson correlation analysis were carried out to determine the relationships between independent and dependent variables. Multiple regression analysis was used to analyze the level of significance in testing the relationship between HRM best practices and firm performance.

5. RESULTS

The results of the demographic characteristics of the respondents show that 57.4% of the respondents are female while 42.6% of the respondents are male. This implies that insurance industry in this country gives female preference in the recruitment and selection process. The study also indicates that the majority of the respondents are aged 31 years and above (80.4%) implying that age is an important factor in appointment of executives, manager and top management. These are responsible positions with high accountability and required a great deal of experience in
carrying out their duties efficiently and effectively. A total of 64.7% of respondents obtained Degree and we can presume that overwhelming majority of the respondents were well educated in their area of expertise. 60.3% of the respondents have been in the industry for at least 5 years of working experience. Majority of the participating insurance firms employ above 200 employees.

Table 1 shows the inter-correlations between measures of HRM best practices whereby the pattern of independent variables are related to the dependent variable by aiming to identify ideal HRM best practices that complement and reinforcing each other. The Pearson’s product moment correlation coefficient values reveal strong correlations within the HRM best practice variables as follows: a) Strategic HRM alignment in the organization and internal communication (r=0.209, α=0.01), b) Strategic HRM alignment in the organization and career planning (r=0.311, α=0.01), c) recruitment & selection and training & development (r=0.338, α=0.01), d) recruitment & selection and performance appraisal (r=0.190, α=0.01), e) recruitment & selection and internal communication (r=0.218, α=0.01), f) training & development and compensation & benefits (r=0.382, α=0.01), g) training & development and performance appraisal (r=0.473, α=0.01), h) training & development and internal communication (r=0.321, α=0.01), i) training & development and career planning (r=0.407, α=0.01), j) compensation & benefits and performance appraisal (r=0.220, α=0.01), k) compensation & benefits and career planning (r=0.303, α=0.01), l) compensation & benefits and job design (r=0.346, α=0.01), m) internal communication and career planning (r=0.408, α=0.01), and n) career planning and job design (r=0.469, α=0.01).

The findings also show a stronger and positive correlation between performance appraisal practices and firm performance (r=0.342, α=0.01) and followed by internal communication practices (r=0.285, α=0.01), career planning (r=0.247, α=0.01), and training and development (r=0.238, α=0.01). This implies that performance appraisal has greatest impact on insurance performance compared with the rest of HRM best practices. Insurance firms view that performance appraisal management is a vehicle for the continuous improvement of business improvement via a co-ordinate program of people management interventions (Walters, 1995). However, the insurance’s performance had negative correlation with job design practices.

The multiple regression model with all eight predictors produced $R^2=0.254$.

**. Correlation is significant at the 0.01 level (2-tailed).

*. Correlation is significant at the 0.05 level (2-tailed).
F (8 303) = 12.93, p<.000. R² value of 0.254 indicates that 25.4% of the variance in firm performance is accounted by Strategic HRM alignment in the organization, recruitment and selection, training and development, compensation and benefits, performance appraisal, internal communication, career planning, and job design and its square. R value of 0.504 indicating a strong relationship between the independent variables (HRM best practices) and dependent variable (firm performance). Findings show that the best predictions of an insurance performance are performance appraisal (β = .376), internal communication (β = .201), Strategic HRM alignment in the organization (β = .183), and career planning (β = .149). These variables explain up to 25.4% of firm performance with performance appraisal taking the lead.

6. DISCUSSION AND CONCLUSION

In this study, we have investigated the relationship of HRM best practices in enhancing firm performance. It was discovered that HRM best practices enhance firm performance. The study found that performance appraisal, internal communication, career planning, training and development, recruitment and selection, and SHRM alignment in the organization have positive relationship on firm performance. The results found in this analysis are consistent with the previous studies, such as performance appraisal, training, and recruitment (Youndt et al., 1996; Singh, 2003(a)&(b); Wright et al., 2005; Cho et al., 2006; Khan, 2010; Quresh et al., 2010; Arumugam & Mojtahedzadeh, 2011; Boohene & Asuinura, 2011), career planning (Fey et al., 2000; Singh 2003(a)&(b); Quresh et al., 2010; Nayyab et al., 2011), internal communication (Guest, 1997; Hoque, 1999; Singh, 2003(a)&(b); Erdil & Gunsul, 2007; Gurbuz & Mert, 2011), and strategic HRM alignment in the organization (Paauwe & Richardson, 1997; Abdullah et al., 2009; Gurbuz & Mert, 2011; Ishak et al., 2011; Osman et al., 2011; Pham, 2011). This study concludes that HRM plays a crucial role in service companies (Schneider & Bowen, 1993) and performance appraisal practices was high in practice in the insurance firms.

Performance appraisal practices are growing as a key role of managing individual performance, discussing critical success factors in the job, and provide the key inputs to decision on merit-based salary increases, training, and promotion (Boxall & Purcell, 2003). Insurance firms stress the importance of effective performance appraisal management based on the belief that everything people do at work at any level contributes to achieving the overall purpose of the organization. It is therefore concerned with what employees do, how they behave, how they perform their work, and what they have achieved. The combined impact of performance appraisal practices will be expected to achieve more to improve firm performance.

The result of this study is consistent with Huselid et al.’s (1997) finding concludes that there is positive link between HRM effectiveness and firm performance. The practices of HRM undertaken in this study are concerned with how people are employed, managed, developed, rewarded, and taken care of as to achieve competitive advantage through the strategic deployment of a highly committed and capable workforce. This shows that organization is highly dependent on human resource to
achieve high firm performance. There has been a debate by numerous academicians on the contribution of HRM practices in firm performance. Lau & Ngo (2004) argues that a firm can achieve high performance through a universal set of HRM best practices. However, Schuler & Jackson (1987); Schuler & Walker (1990); Dyer & Reeves (1995) view that HRM strategy would be more effective and efficient when appropriately integrated vertically between an organization’s business strategy and its HRM policies and practices.

The implications of this study indicate that insurance firm must strategically manage its human resource practices to achieve maximum performance. Human Resource Personnel should focus on how to develop and sustain its human resource through effective HRM best practices to enhance current and future performance of the organization. The HRM system in Malaysia went through great transformations in the early 1990s and one of the main goals of HRM system is to ensure that HRM best practices are integrated with the strategy and the strategic needs of the firm in order to achieve sustainable competitive advantage. Conclusively, the contribution of this study is that effective HRM practices organises the overall organization-level HRM measures with the goal of gaining competitive advantage through human resources that will lead to high firm performance.

7. LIMITATIONS AND FUTURE DIRECTION

This research has several limitations. The construction of the research questionnaire did not consist of sufficient items to explore the relationships between HRM best practices and firm performance. Only eight out of a wide range of possible HRM best practices were selected in this study. Selection of HRM best practices items were based on the most popular HRM best practices quoted from previous studies. Therefore, the results of this study may be biased. This study only focused on the Malaysian insurance industry and the results may differ from other industries in Malaysia or other countries. This study may be taken up to cover a wider area such as insurance business unit branches and more respondents with cross cultural extensions. Future researchers may take up studies on HRM for these aspects.

Извод

Универзална перспектива менаџмента људским ресурсима подразумева да сет практичних алата може унапредити конкурентску предност и показатеље компаније. Ова студија се заснива на покушају истраживања односа између праксе управљања људским ресурсима и перформанси компаније. Како би се сакупили полазни подаци коришћен је упитник, док је испитивање вршено личним приступом. Популацију која је истраживана (312 испитаника) сачињавали су нижи, виши и висок менаџмент нивои из седам највећих осигуравајућих компанија из Клент низије у Малезији. Истраживање је показало да је се најбоља пракса менаџмента људских ресурса састоји у унапређењу личних перформанси, унутрашњој комуникацији и планирању каријере запошљених.

Кључне речи: пракса управљања људским ресурсима, компаративна предност, перформансе компаније, осигуравајуће компаније, Малезија
